Abstract:

This article is written about the role of student activity in the educational process of digitization, the data system, the Hemis program and the system of credit modules. The article shows the specific significance and role of digitalization in the educational process of students. The article, written on the basis of scientific research, promising scientific considerations and practical experience related to this topic, also outlines the Hemis program and the system of credit modules.

Keywords: Education, digitization, data system, Hemis program, credit module system, activity, importance, research, perspective, feedback, practice, experience, analysis and forecast.

Today's updated world cannot be imagined without digital technologies. Whether it is an educational system or a production system, it has taken its first step in all areas, and these updates have been laying the groundwork for a person to live better and operate more freely. In particular, when digitizing education, we can see many jewels of modernization like this. Most of the current higher education campuses operate through the hemis program and the credit module system. This process allows you to fully control and perfect the process of subjects in student specialties, as well as the work activities of teaching and pedagogical professors.

The introduction of the hemis program and the concept of a credit module into the educational system of our country took place based on the educational system of developed countries, moreover, these systems have acquired a very rapid adaptation among students and young people. Alternatively, it is appropriate to consider the increased quality of education as a result of the functioning of these systems and the positive reaction of student youth. During this stage, it is necessary not only to demand new views and strong activity from the student youth, but also to support their scientific

potential and new worldviews. That is, we and students like us should show our activity in digitizing the educational sphere and contribute to the creation of a new educational system with our own hands, as well as a new one. In this regard, it is not difficult to notice how important and social the activity of this sphere is, since many of the main accents in the strategy of our President "Digital Uzbekistan-2030" are aimed precisely at the tasks within our education, in particular at the digital stage in the education system. Therefore, it is worth noting that huge successes have been achieved within this stage and new, potential and intellectually thinking personnel have been identified, which are closely related to the digitalization of education. A lot of work has already been done within this system, including the fact that each educational institution also has its own educational assessment system described above. The fact that almost all education systems in the country have switched to this digital system leads to a sharp change in educational activities, primarily of students and youth, as well as teachers. It is worth noting here that this activity is seen as more transparent and large-scale than the traditional education system.

Emphasizing the transparency of assessment in the framework of digitalization of education, in accordance with the points set out in the decree of the President of the Republic of Uzbekistan dated October 5, 2018 No. PP-3775, from this year the participation of teachers who taught within the discipline in the final control assessment of the student and the stages of passing the final control was canceled. This has led to a reduction in the human factor even due to the system of presentation and evaluation of control in digitized form instead of the traditional method, which ensures transparency of self-assessment and education. In accordance with the resolution of the Ministry of Higher and Secondary Special Education of the Republic of Uzbekistan No. 30 dated January 15, 2021, work has begun on the transition of almost all higher educational institutions of the country to the system of educational platforms "credit module" and the compilation of a number of relevant documents. By now, this system has already started working in almost all higher educational institutions of our country. Again, in this digitized education system, a part of elective subjects was introduced for all students, which are not available in the traditional education system, this part allowed students to choose subjects that they consider necessary and train teachers in this subject of their choice. the most important factor. So it would not be an exaggeration to say that the system of elective education is also a step in the digitalization of education. On the basis of this work, it is appropriate to say that our president trains young personnel with potential and outstanding specialists in the relevant field. So within the framework of this system, we all need to unite and show our activity in its development. At the same time, bringing our renewing Uzbekistan to the forefront and further digital development of our education system means the human duty not only of civil servants of education, but also of all students to their Homeland. As part of this work, fundamental organizational work is also being carried out in most higher educational institutions of our country, within the framework of which assessments, methodological manuals, the duration of attendance of classes and a number of similar projects have

already been introduced in each department of education, as well as educational and methodological classrooms are provided with the most modern equipment and each of these classrooms is equipped with video recorders. The availability of surveillance equipment is also an indicator of the digitization of education. It is worth noting here that such a scale of work and the opportunities created should become our highest goal, so that we and the student youth, like us, show their activity and raise it to the level of the requirements of the time.
